

## Press release

### **Administration of cargo handling devices: Working local or using the Internet? „PLV“ combines the best of two worlds.**

Riedel GmbH introduces new version of her software application

**Hamburg, 23.04.2009** - At the transport logistic exhibition 2009 the software house Riedel GmbH introduces a new version of the software application „PLV“, a solution for pallet-bookkeeping, cargo handling device administration and container tracking. It not only allows a flexible analysis of cargo handling device accounts with the windows application but now offers a web module for data input via intranet or internet. Windows- and web module are using the same database, so all data entered over the web is immediately available in the windows application to be analysed.

Account statements can be generated as lists or letters, exported to Excel or sent directly as mail to the customer. Additional options like container tracking, account balancing at individual dates, generating of invoices and credit notes as well as clearing of rental fees are making PLV an efficient tool. The program helps all employees to keep track of exchange cargo handling devices and avoid losses.

On stand 617 in hall B2 an overview of the application will be presented and a free demo version is available.
